

Operable Wall Definition:

An operable (movable) wall is a system of individual solid or glazed panels that can be moved independently from each other which when fitted together end to end form a continuous flat, faceted or curved wall. Operable wall panels are designed to be easily manoeuvred and operated. They are top hung from either a surface or recessed mounted head track and no floor track is required. Various head track formations are possible to provide different stacking options.

Each panel is provided with interlocking seals to each vertical profile, retractable top and bottom seals are either manually or electrically operated. The seals pressure close against the ceiling channel and floor to provide a continuous seal. Individual panels can incorporate single or double door sets and junction panels to form various configurations.

Final closure of the wall can be by a telescopic panel, extending wall jamb or full height door.
